Subject:

Rush search request for 09/403440

Please search in commercial database, issued patent files and PGUB:

The peptide SEQ ID NO:2, with and without size limitation for the sequences in the database to the size of SEQ ID

NO:2.

Thank you.

MINH TAM DAVIS

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer. Found in a complex with

CABLES1 and p53/TP73. Interacts with histone acetyltransferases

EP300 and methyltransferases HRWT1L2 and CARM1, and recruits them

to promoters. C-terminus interacts with TAP1, when TAP1 is part of

the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and

P53DINP1. Part of a complex consistiting of TP53, HIPK2 and AXIN1.

Interacts with WMOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

                                                     SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). Prim: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated by HIPKI (By similarity). Prim: Acetylated. Its deacetylation by SIRT1 impairs its ability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases appoptosis induction seems to be mediated either by simulation of appoptosis induction seems to be mediated either by simulation of appoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BAX and FAS antigen expression,

expression.

COFACTOR: Binds 1 zinc ion per subunit (by similarity).

COFACTOR: Binds DNA as a homotetramer. Found in a complex with SUBUNIT: Binds DNA as a homotetramer. Found in a certyltransferases EP300 and methyltransferases HRMTIL2 and CARMI, and recruits the to promoters. C-terminus interacts with TAFI, when TAFI is part the TFIID complex. Interacts with HIFK1, HIFK2, AXINI, and P53DINP1. Part of a complex consistiing of TP53, HIFK2 and AXIN Interacts with WMOX (By similarity).

Thereacts with WMOX (By similarity).

Thereacts with MWOX (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     տ
                                                                                                                                                                                                                                                                                                                similarity). is found in increased amounts in transformed cells. p53 is frequently mutated c many types of cancer. SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRKI, which may prevent the interaction with MDM2. Phosphorylated by HIPKI (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                          induce
                                                                                                                                                                                                                                                                                                                                                                                                                        PTM: Acetylated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Apoptosis induction seems to be BAX and FAS antigen expression,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Induces 58:50-04(1777).

FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of max antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EP300 and methyltransferases HRMT1L2 and CARM1, and recruits them to promoters. C-terminus interacts with ThF1, when ThF1 is part of the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and P53DINP1. Part of a complex consisiting of TP53, HIPK2 and AXIN1. Interacts with WWOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). Fine Phosphorylated. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated by HIPK1. Phosphorylated on Ser-46 by HIPK2 upon UV irradiation. Phosphorylated on Ser-46 is required for acetylation by CREBBP (Proceedings).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               similarity).
DISEASE: p53 is found in increased
Frankformed cells. p53 is frequent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=90045967; PubMed=2530498;
                                                                                                                                                      transformed cells. p53 is frequently m many types of cancer.
SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                                                                                                               SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity). PTM: Phosphorylated. Phosphorylation on Ser residues mediates transcriptional activation. Phosphorylated on Thr-18 by VRK1, which may prevent the interaction with MDM2. Phosphorylated on Thr-55 by TAF1 which promotes MDM2-mediated p53 degradation. Phosphorylated by HIPK1 upon Phosphorylated by HIPK1. Phosphorylated on Ser-46 by HIPK2 upon
                                                                                                                                                                                                                                                                                                                                                                                                                     CABLES1 and p53/TP73. Interacts with histone acetyltransferases EP300 and methyltransferases HRWT1L2 and CARMI, and recruits them to promoters. C-terminus interacts with TAF1, when TAF1 is part of the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and p53DINP1. Part of a complex consisting of TP53, HIPK2 and AXIN1. Interacts with WMOX (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression.

COFACTOR: Binds 1 zinc ion per subunit (By similarity)

Biochem. Biophys. Res. Commun. 295:644-650(2002).

-:- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COPACTOR: Binds 1 zinc ion per subunit (By similarity).

COBACTOR: Binds DNA as a homotetramer. Found in a complex with CABLES1 and p53/TP73. Interacts with histone acetyltransferases EP300 and methyltransferases HRWILL2 and CARMI. and recruits the to promoters. C-terminus interacts with TAF1, when TAF1 is part the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and P53DINP1. P33DINP1. Part of a complex consistiting of TP53, HIPK2 and AXIN1. Interacts with WWOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

PTM: Acetylated. Its deacetylation by SIRT1 impairs its ability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      by CREBBP (By similarity).
DISEASE: p53 is found in increased amounts in a wide variety transformed cells. p53 is frequently mutated or inactivated:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which may prevent the interaction with MDM2. Phosphorylated on Thr-55 by TAF1 which promotes MDM2-mediated p53 degradation. Phosphorylated by HIPK1. Phosphorylated on Ser-46 by HIPK2 upon irradiation. Phosphorylation on Ser-46 is required for acetylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTM: Phosphorylated. Phosphorylation on Ser retranscriptional activation. Phosphorylated on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          many types of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        induce proapoptotic program

FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis Induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MOD RES

                                                                       SUBUNIT: Binds DNA as a homotetramer. Found in a complex with CABLES1 and p53/TP73. Interacts with histone acetyltransferases EP300 and methyltransferases HRMIL2 and CARM1, and recruits them to promoters. C-terminus interacts with TAF1, when TAF1 is part of the TFIID complex. Interacts with HIPK1, HIPK2, AXIN1, and P53DINP1. Part of a complex consisiting of TP53, HIPK2 and AXIN1. Interacts with WWOX (By similarity).

Submitted (AUG-1999) to the EMEL/GenBank/DDBJ databases.
-i- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MOD_RES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Name≖TP53; Synonyms≂P53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Q9TTA1;
                                                                                                                                                                                                                                                                                                                                                                                                 COPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Binds DNA as a homotetramer. Interacts with histone acetyltransferases EP300 and methyltransferases HRWT12 and CARM1, and recruits them to promoters. C-terminus interacts with TAF1, when TAF1 is part of the TFIID complex. Interacts with HIPK1, when TAF1 is part of the TFIID complex consisting of TP53, HIPK2, AXIN1, and P53DINP1. Part of a complex consisting of TP53, HIPK2, HIPK2, CONSTRUCT WITH WMOX (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic and nuclear (By similarity).

PTM: Acetylated. Its deacetylation by SIRT1 impairs its ability to
                                                                                                                                                               transformed cells. p53 is frequently mutated or inactivated many types of cancer.
SIMILARITY: Belongs to the p53 family.
                                                                                                                                                                                                                  transcriptional activation. Phosphorylated on Thr-18 by VRKI, which may prevent the interaction with MDM2. Phosphorylated on Thr-55 by TAR1 which promotes MDM3-mediated p53 degradation. Phosphorylated by HIPK1 (By similarity). Phosphorylated on Se by HIPK2 upon UV irradiation. Phosphorylation on Ser-46 is required for acetylation by CREBBP (By similarity). DISEASE: p53 is found in increased amounts in a wide variety.
                                                                                                                                                                                                                                                                                                                                                 PTM: Phosphorylated. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

⋛

29-OCT-1998. Synthetic. p53 homologue TIP peptide. (UYDU-) UNIV DUNDEE 22-APR-1997; 20-APR-1998; WO9847919-A1 p53; mdm2; inhibitor; therapy; activator; treatment; cancer; medicament. 22-FEB-1999 AAW82321; (first entry) 97GB-00008089 98WO-GB001140.

New substance with a mdm2 binding domain and coupling partner - useful for stabilising in cells without an efficient mdm2-mediated degradation

WPI; 1998-609975/51.

Lane DP;

Disclosure; Fig 1; 52pp; English.

This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows level p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53

                                                                                                                                                                                                                                                                                                                          This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New agents which inhibit interaction of p53 and mdm2 - useful activating p53, e.g. for treating cancers, viral conditions of conditions associated with non functional p53 or mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               p53 homologue

binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated levels of MDM2. The peptides may be used to identify molecules that bind to MDM2 and to identify and design inhibitors of MDM2/p53 binding. They may also be used to purify binding partners especially MDM2, diagnose disease by measuring levels of MDM2 in blood of cancer and leukaemia patients and for treatment or prevention of disease involving p53/MDM2 interactions, especially tumours and viral infections. The peptides can be administered nasally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can activate p53 function and accumulation in normal cells. The peptides which mimic the MDM2 binding site in p53, have a significantly greater blocking activity compared with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            assay for analysing the interaction between human oncogenic protein MDI and p53. The invention provides peptide derivatives capable of binding the human MDM2. These peptides can specifically inhibit or block the binding the human MDM2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Compounds binding to MDM2 protein and inhibit its useful in, e.g. diagnosis and treatment of cancer and identifying binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This represents a p53 N-terminal peptide fragment used in an Elisa TIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 34; 45pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       p53 N-terminal peptide fragment for Elisa TIP assay.
                                                                                                                                                                 AAE30863 standard; peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a peptide for use in modulating the binding of p53 polypeptide to a p300 polypeptide. The new peptide is useful in modulating the binding of a p53 polypeptide to a p300 polypeptide. The peptide may be used to regulate the mammalian cell cycle or to induce or prevent cell death, for the treatment of cancer or ischaemia. The invention is useful in gene therapy. The present sequence is EGFP-BOX-1 domain phospho-peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                               transformation-associated protein.
                                                                                                                                                                                                                                                                                                                                                                                   cancer: pre-cancerous state; detection; diagnosis; human p53
immunodominant epitope; human cellular tumour antigen;

                                Antibodies specific for p53 are detected by binding to immobilised fragments of the p53 gene product containing the antibody-binding region. Preferred fragments contain amino acids 1-241, 40-349, 40-393, 66-241, 66-393, 237-349, 237-393 and esp. 9-33, 37-52 or 368-386. See AARS1872-R51881 for sequences of these fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides AAM60202-05 are derived from human p53 protein. The present peptide corresponds to residues 11-35. The pptides are used in the method of the invention. Antibodies that bind to p53 protein are detected by immobilising a p53 peptide directly on to a flow cell of a sensor chip in a biosensor, treating the peptide with a sample of patient serum, diluted in buffer, and measuring binding of antibody to the peptide using the biosensor. The method is used to monitor cancer patients undergoing p53 gene therapy (to determine if an immune response has developed), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting antibodies that bind p53 by reaction with immobilised p53 peptide(s) - attached directly to flow cells in the sensor chip of biosensor, used to analyse serum from cancer patients, e.g. those being given p53 gene therapy.

                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method of synthesis of biologically active CC substances of determined structure directly in the cells of living CC organisms containing specific RNA or DNA sequence. The method is based on CC the hybridisation of two or more oligomers bound with biologically CC inactive substances to specific RNA or DNA in vivo in the cells of living CC organisms. After hybridisation of the oligomers, the biologically CC inactive precursors bound to the oligomers can interact with each other CC to make the active form of the substances. This changing of properties is CC due to chemical reactions which bind the biologically inactive precursors CC through a chemical bond into a biologically active form of the whole compound. The methods are useful for producing biologically active compounds from inactive precursors. These compounds may be inhibitors or Stimulators of cellular metabolism, DNA replication, RNA transcription, CC RNA translation, RNA elongation RNA processing, protein synthesis, CC protein processing, cellular fifterentiation, cell division, ion channel CC transmission, cellular protein and RNA transportation, processes of CC cellular oxidation, toxins, proteins or RNAs. AAB30523-36 represent CC peptides are fragments of the two compounds activator mRNA (AAC62167-60) or human NbHOT (AAC62181-94). The method of the invention is used to cardiot the two componers and

The method is useful for identifying ligands that can mediate the biological activity of target proteins via inhibition of the binding of target proteins to a binding partner ligand. The invention does not require that the natural binding partner be used as reagent. The need for the natural binding partner be used as reagent. The need for the natural binding partner be used as reagent.

                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The peptides AAW13602-6 represent peptide fragments derived from the wild type human p53 protein. This peptide corresponds to amino acids 6-41 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which has now been shown that the mdm2 protein tesulf has oncognic properties, especially in a p53-null background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by over-expression of the p107 protein. The p53 CC peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; myeloid leukaemia; B cell lymphoma, or other hyperproliferative conditions such as restenosis. Note: this sequence is not given in the colon; cancer of the breast of the man p53 sequence
